

LAND BOUNDARY · TIMOR-LESTE

Galvanized BRC Mesh Fence for a Coastal Land Boundary in Timor-Leste

LOCATION

Timor-Leste

PROJECT TYPE

Land Boundary

FENCE LENGTH

~700 m

FINISH

Hot-Dip Galvanized

CHALLENGE

The client needed to mark and secure a long stretch of land boundary running near the coastline, crossing rolling, uneven terrain rather than a flat, straight run. The fence line had to hold a consistent, professional appearance over hundreds of meters of undulating ground while standing up to the humidity and salt exposure of a seaside site.

SOLUTION

Shengsen supplied a run of galvanized guardrail mesh panels set on precast concrete plinths, allowing each section to step and angle with the natural contours of the land rather than forcing a rigid straight line. The heavy-gauge posts and panels were hot-dip galvanized throughout to resist corrosion in the coastal climate, and the concrete footing gave the boundary a solid, permanent base even on loose or rocky ground.

RESULT

The finished boundary line follows the coastline and hillside smoothly for roughly 700 meters, giving the client a clearly defined, durable property line that will hold up to years of coastal weather with minimal maintenance.
