Custom 3D Welded Wire Perimeter Fence for a Wooded Residential Property

LOCATION

UNITED STATES

PROJECT TYPE

Residential

FENCE LENGTH

390 m

FINISH

Black PVC Coated

CHALLENGE

The homeowner needed a long perimeter fence running through wooded, uneven terrain and along a gravel driveway, enclosing the property line where it wove between mature trees. A traditional install using poured-concrete footings would have been slow and disruptive to the root systems and natural landscape the owner wanted to preserve.

SOLUTION

Shengsen supplied 3D welded wire fence panels finished in PVC black, paired with matching single-leaf and double-leaf gates for the driveway and walk-through access points. The panel-and-post system was designed for direct-drive installation, allowing the posts to be set straight into the ground without concrete, so the fence line could follow the natural contours of the wooded property.

RESULT

The homeowner drove the posts three feet into the ground using a skid steer alone — no concrete required — and the fence held solid along its full run through the trees and driveway. As the customer put it: *“It is very solid. I love the fence.”*
